The e-Frontier: Electroacoustic Music, Multimedia, Education, and Audiences in the Digital World (Part 1)

by Alex Shapiro

The abundant sound of an acoustic symphonic wind band is one of the grandest things I’ve ever felt. And, heard. Augment it with the sonic landscape of a stereo audio track, and the emotional impact of the ensemble can be nearly overwhelming in its beauty and power.

We don’t just hear music with our ears, we absorb it through our entire body. Audiences accustomed to live music lunging at them from the stage, are now embraced by additional sonorities streaming through speakers from the left, the right, and sometimes even from behind. It is this potent combination of expressive, sensual forces that drives me to compose music for electroacoustic wind band.

During the 1980’s and ’90’s, I made a very modest living in Los Angeles, California, scoring low-budget film and television projects. Like any composer in that business, I put together a professional recording project studio filled with the latest sequencing, sound design, and engineering applications. Having worked with electronic music since 1977 when I was 15, I became adept at using these newer, ever-improving tools to produce soundtracks in any genre when, regrettably, there was no budget for live musicians. The majority of underscores for almost all present-day television shows and many feature films is electronic, or largely so with the addition of only a few live players – whether the track emulates actual instruments with samples, or uses sounds that cannot be achieved any other way.

In the late 90’s, I shifted my career entirely to writing for the concert stage, and composed a great deal of chamber music for small ensembles. While much of it was purely acoustic, I grew increasingly interested in using my digital studio to incorporate a prerecorded track in the instrumentation, to accompany a soloist. That curiosity, and the natural progression that followed from it broadened significantly when I began writing for wind band. “Why not,” I asked myself, “put these two magical sound worlds together?”

The nature of the beasts: the audio track, and the composer

In each of my electroacoustic symphonic band works, I treat the prerecorded track as an organic, additional section of the ensemble that has its own distinct sound. The woodwinds, the brass, the percussion, the rhythm section, and yes, the lonely upright bassist, all have unique timbres and...
I usually compose vertically, measure by measure and phrase by phrase, orchestrating all of these sections simultaneously, as opposed to writing the acoustic parts first and then adding the electronics as an “accompaniment track,” or, creating the track and then orchestrating for the musicians atop that. I take a holistic approach to composing that results in an evocative, and potentially enormous wall of sound. My intent is to seamlessly meld the live and recorded elements in such a way that listeners cannot tell where one begins and the other ends. My goal is to use this extended palette to create music that connects in unexpected ways with those who perform it as well as with those who hear it.

I don’t use emulative samples; there’s no reason to duplicate the sound of an actual instrument, when that instrument exists in the band and can be played by a living, breathing (sometimes gasping) human being. To me, the artistic joy of adding electronics is to devise original sounds that can’t be produced by the musicians (unless maybe you pinch them hard, and I’ve heard they don’t like that very much).

When I begin a new piece, I give a lot of thought to defining what I’ll attempt to communicate during the journey, and to devising the map, somewhat determined by the targeted duration of the piece. Once that architecture is roughly in place, I collect the sonic elements of the soundscape that support the emotional direction of the music. Is it ambient and ephemeral? Are the pitches floating and variable, or are they literal? Is it wildly percussive? I often spend a couple of weeks putting the first iteration of my sonic paintbox together, as I cull existing sounds and original samples that will form the audio “section” of the band.

I’m aware that as the music writes itself (courtesy of very kind muses I bribe to show up for work with me, by offering them good coffee, dark chocolate, red wine, and anything else they demand as payment that won’t get me arrested), this initial set will expand and change: sounds I loved and thought I’d surely want to use will suddenly have no place in the piece, and other audio gems will be discovered. I very much take to the heart the advice of Sir Arthur Quiller-Couch, who said to improve one’s creative work one must be willing to “murder your darlings”.

Creating the soundscape

The first method is to start from scratch and create audio samples by recording sounds that I find (such as the Pacific Humpback whale song I use in IMMERSION and its third movement, BENEATH), or that I make (for instance, water sloshing in a metal bowl, for my piece LIQUID COMPASS). I use an audio editing application, in this case DSP-Quattro, to carefully “clean” the samples by adjusting the start and end points, removing background noises or hum, and equalizing the frequencies to my liking. Then I import them into a sample.
playback application, such as MOTU’s MachFive3. From there I map each sound across different pitches, and trigger those pitches via a controller keyboard. More sonic tweaking will occur further down the road, as I choose effects and any other filters to enhance the samples in the context of the music. A slosh is not a good slosh without this level of detail. (Think about this next time you’re in the kitchen washing the dishes).

The second way many composers work, once we know roughly the sonority we want, is to peruse the massive folders of existing sounds found within the virtual instrument libraries that take up a great deal of the space on our external hard drives. Once we find something relatively close to what we’re looking for, the following step is to use the remarkable tools found in applications such as Kontakt, MachFive3, Omnisphere, Absynth, or countless others that allow us to significantly alter the sound file, to achieve the exact nuance we have in our head as the composer. This can involve changing the envelope (the timings of the attack, the decay, the sustain and the release), running it through filters that affect its frequencies, panning it for further stereo effect, EQing it, adding delay, phasing, chorus, detuning, reverb, or the myriad other effects processes, and so on. The possibilities are nearly limitless.

I often say that composing is the perfect job for a control freak. Doing so for an acoustic score – marking every note, articulation, dynamic, and slur – is a spectacular opportunity for the basic, garden-variety control freak who realizes (with great consternation) that once the music is in the hands of actual instrumentalists, it will be altered to some degree. But what about when that composer creates an electronic track, and painstakingly adjusts each sound to extremely specific details that never change? Well, that brings the Average Composer Control Freak into the realm of Executive Composer Control Freak Pro Deluxe! The track will always play back the same, performance after performance.

Benefits to students

In addition to the thrill of offering audiences a big, cinematic sound experience, electroacoustic wind band pieces present many advantages to the musicians who bring the music to life, each of which is further amplified for younger, less experienced musicians who have yet to develop their range, breath control, intonation, and rhythmic sophistication.

Audio: prerecorded, and live

Essentially there are three different methods composers use when producing an electroacoustic band piece. The first is the simplest, and the one that I choose for each of my works: using a prerecorded audio track that will reliably (one hopes!) play back via a free application such as iTunes or Audacity on a laptop, or even via that antiquated shiny object known as a CD.

Other ways of generating sound involve live electronics. One method is entirely interactive, often using an application called Max/MSP which can control visual effects as well as audio. The composer can program a sequence of patches in such a way that various sonic (or other) events occur, each triggered by what is played by the live ensemble.

Another related method is a combination of the two, whereby existing, prerecorded events are individually triggered in real time by someone at a laptop, using an application such as Ableton Live.

The sophistication of what can be achieved with these real-time techniques is unquestionably wonderful. Nonetheless, I have witnessed too many stressful occasions...
when the programs did not run smoothly, or crashed entirely and rudely truncated a concert. In my own pieces, I continue to opt for straight playback that requires no human counterpart – and I advise my far braver colleagues to create prerecorded backups of their live electronics whenever possible, if only to have a Plan B at the ready, just in case.

The composer as engineer

Understanding the engineering concepts involved in creating a successful audio track mix becomes a crucial aspect of composing electroacoustic music. The composer is no longer just a writer, but now a recording engineer and record producer (cool sunglasses and pony tails are optional). Even if the track is outsourced for mastering (a process that balances the levels and frequencies), a composer still needs a solid understanding of what will – and what might not – sound good alongside the acoustic instruments.

Among the most important aspects of a successful track is frequency placement. All music, acoustic or electronic, is comprised of layers of sound frequencies from the very low to the very high. The beauty of a wind band or orchestra is that the ensemble represents a broad spectrum of these sound colors, and that’s of course why well orchestrated pieces are so satisfying to hear.

When composing and later mixing the audio track, in order to avoid a muddy sound, it’s a good idea to consider the vertical array of musical lines and frequencies, and to try not to have them clustered tightly together in the same sonic spaces unless that is the desired effect. Each frequency should have its own place in the mix, and this can be further enhanced by the virtual placement of the sound using panning techniques.

Adding a live ensemble into the mix means that there are more frequencies – plus, overtones and ring-outs – to consider. What might seem feasible in one’s home studio can end up sounding quite different in a large hall. Experience becomes an excellent teacher!

The click track

In all but the most regular, percussive pieces (like my groove-based TIGHT SQUEEZE), a click track is necessary in order for the conductor to keep the ensemble in exact synchronization with the audio track. Depending on the needs of a piece, two kinds of click tracks can be used: one with fixed audio clicks that are even and regular, and the other with variable clicks, that reflect changes in tempo like rubato, accelerando, or ritardando. Any combination of beat patterns can be incorporated, to easily represent complex meters or serve specific conductor requests.

The click can either be mixed to one ear, or combined on both the left and right along with the stereo audio track. Downbeats are louder or different timbres, and the click volume is high enough to compete with everything else and keep the conductor on track – literally!

New skills for conductors

It usually doesn’t take long for a conductor to become comfortable with the click and audio track in his or her earbud or headphone, but there are adjustments to be made. The most startling one is that suddenly, the conductor is not the one making the tempo choices! (And we all know what control freaks conductors are – that’s why they get along with composers so well.) The track is fixed, and will play back the same way, every time. The click becomes the “anti-conductor.” It might fly in the face of what the human being on the podium would opt for at certain points in the music. The person holding the baton quickly becomes a savvy time keeper, while still finding ways to preserve musicality and natural flow within the confines of a strict pulse. Depending on the music, there are creative ways to “give away” time to allow a short section to breathe, and then “pay it back” a little later in the piece so that everything stays in sync.

Part of the fun of wearing a headset and conducting to a click, is that it instantly turns any band director into a Hollywood scoring session conductor, using the identical techniques with which blockbuster movie scores are recorded.

Notation: what’s in the score

Most conductor scores for electroacoustic pieces look remarkably like any other score. They normally include a note at the start stating how many “free clicks” there will be prior to the downbeat, and the one or two measure lead-in time is usually included in the timings because that’s where the track will play from. Those timings will be to the second, and used for reference against the track. These timing indications are most often located at double bars and rehearsal numbers (or letters), so that it’s easy to pick up a cue in the middle of the piece by moving the counter in iTunes on the laptop (for instance) a little before the timing on the rehearsal number downbeat.

For even more control, the audio track can be split into what are referred to as regions, which behave like separate tracks from which a conductor may start. There are usually one or two music staves at the bottom of the score that represent what is heard in the track. For additional clarity, text, in or outside of boxes, is used to describe sounds and effects that can’t be easily notated. Some composers rely heavily on graphics. I use a few obvious or artistic ones sparingly. But being a ridiculously practical person, I like to make the score-reading process as immediate and easy as possible. So if a sound cannot be notated by pitch or rhythm, I’ll enter a very brief text description.

Hooking it all up: rehearsal and performance setup

Fortunately, the technical requirement to rehearse and perform electroacoustic pieces is very simple. Both the rehearsal room and the performance venue will need a basic PA system (mixer, amplifier, house speakers), ideally with stereo stage monitors that can play loudly and facing the band. If possible, another set should be placed in the back of the stage near the percussion section to

ensure that everyone hears the same downbeats. Sometimes percussionists – particularly anyone playing drum set – are given an earbud with the click so that they can stay in sync with the track. Even though the eyes of the band members are on the conductor, their ears are most likely tuned in to the drummer! If the drummer deviates from the actual tempo, the whole band usually follows. This makes the conductor’s work more challenging as he or she strives to bring everyone back into sync and avoid the piece becoming a wager-worthy sporting event where bets may be placed on which section crosses the double bar first.

There are normally at least two audio files that come with a score. One is the audio track in its stereo performance mix that will be heard over the stage monitors by the band and over the house speakers by the audience. The other is a mix for the conductor that includes the audio track mixed with a click track for in-ear monitoring through headphones or earbuds. Sometimes a conductor chooses to leave one ear uncovered, in order to clearly hear the live band against the track.

For the conductor, any stereo earbuds or headphones will work. In a perfect world, a wireless, single-ear summed stereo earbud, with a clip to hold it in place, is what should be used to hear the click and the track in one ear, and the live band in the other. Wireless is preferred because it offers the greatest freedom of movement.

The headphones or earbuds are plugged into a small box called an audio interface that is, in turn, connected to a laptop computer and an audio mixer. The audio interface routes one set of tracks to the stage and to the house, while routing the other with the click to the earbud to the conductor. Almost any 4-channel I/O (in/out) interface will work.

Using a simple multitrack digital audio application such as Audacity or Garage Band, allows the audio track with the click to be loaded into one stereo channel.

Monitors, speakers, laptop, audio interface, and microphones, if desired, are connected by cables to the mixer, which is usually centrally placed in the back of the auditorium, or otherwise, on the side of the stage or next to the podium. It’s helpful to also have one or two stage monitors at the rear of the stage, so that the percussionists can clearly hear the pulse of the track.
solely for the conductor. The track without the click is loaded into two more stereo channels: one pair routed to the stage (and podium) monitors so that the band and conductor can hear the track, and another pair routed to the house speakers for the audience. Many audio tracks use panning effects, so it’s important that everything is routed to the audience in stereo.

An additional stereo channel may be used to route an optional pair of stereo microphones placed over the band. If the band is mic’ed, it’s best to have an engineer reading a music score to ride the faders at the mixing board and control the balance.

As with all music, there’s going to be a vast difference between the acoustics in a band rehearsal room, and those of the hall where the concert will take place. It’s wise to mentally prepare for this during rehearsal, because this difference will be magnified when presenting a piece that includes an audio track. Balances (is the band, or the track, too overpowering?), and basic equalization (is there too much low-end, or any distortion, coming over the speakers?), will always require some attention. Every room and hall is different, whether it is empty or full of clothed, sound-absorbent people! A venue filled with naked people will of course be more resonant, without all the fabric to absorb sound.

Offering online resources

Composers can be helpful by offering a technical setup guide along with the track downloads. This will make it easier for the band director to set up things for rehearsal. Because composers have multimedia websites, it’s easy for them to also offer score-specific resources for streaming or downloading audio, video, and additional curricula, including: score samples, articles, interviews, tracks for download (especially for students, so they can practice at home!), links to program notes, performance notes, rehearsal techniques, errata (fantastically helpful for conductors!), additional technical info, how-tos, software links, explanatory videos, an mp3 of the full piece, and — or course — information about how to obtain the music!

Building trust, broadening ears

One of the skills ensemble musicians develop as they become familiar with performing, is the ability to adjust for their surroundings. The sound they hear from their specific locale on the stage translates differently when the entire ensemble is heard from a seat in an auditorium. When we add the presence of integrated music coming through the house speakers that is meant to blend seamlessly with the band, a musician’s listening skill is challenged even further.

Even with stage monitors pointed toward the band that play the track for them as they perform, there’s really no perfect way for musicians to fully sense the complete effect of band and track as heard by their audience. Musicians need to be encouraged to have faith in an end result that they won’t be able to hear — or see, in the case of music that has visual elements, such as my piece, PAPER CUT, which uses printer paper as a percussively sonic and multimedia element.

A little bit of psychology goes into building this trust, and one of the best examples I can think to use when rehearsing with a band, is to compare the electroacoustic music process to what’s called the “green-screen” effect in Hollywood. Everyone has seen it: actors are filmed in front of — you guessed it — nothing more than a very plain bright green (sometimes blue) backdrop, and perform as though they are in a far more elaborate setting. That setting, however, will be assembled much later, using additional layers of footage or graphics. The end result will be seen by movie-goers as though it was all shot at the same time. In this instance, the musicians are the actors. They have to use their imagination to think about what the combined sound of their work and the track will eventually be in the hall, even though they can’t hear it themselves on stage.

I enjoy giving musicians an extended way to perceive their role as performers. I want to expand students’ relationship to the music on their stands, and to the human beings who sit in the auditorium in front of them. We have become a highly multimedia, interdisciplinary society. Those of us on a stage should be aware of the entire impact of our performance, sonically and visually. We are now performing for audiences more familiar with staring at something that moves, rather than at something that merely makes sound.

YouTube is currently the most popular delivery platform for music, and the internet has become an organic, nearly invisible aspect of our daily lives. In the next issue of WASBE World, look for Part Two of this series in which I delve deeply into the fantastic new e-frontier of multimedia, social networks, and how our lives as music-makers are expanding far beyond anything we might have imagined only a few years ago.

Called “one of the most noteworthy composers for the 21st century wind band” by Carthage College and Dr. James Ripley upon the premiere of her 2014 electroacoustic symphonic wind band piece LIQUID COMPASS, Alex Shapiro has emerged as a pioneer of inventive approaches that use new media to create music and meaningful relationships among colleagues. Drawing from a wide musical palette that defies genre, Shapiro’s acoustic and electroacoustic works, published by Activist Music, are performed and broadcast daily across the U.S. and internationally and can be found on over twenty commercially released recordings from around the world. In 2011, the national music fraternity Mu Phi Epsilon presented Ms. Shapiro its highest distinction, the Award of Merit, for her innovative use of new technologies in composing and for her efforts in encouraging her colleagues.

Alex is the author of a chapter titled, Releasing a Student’s Inner Composer for the 2013 GIA Publications book, Musicianship: Composing in Band and Orchestra, and two of her groundbreaking electroacoustic wind band pieces for high school musicians, PAPER CUT, and TIGHT SQUEEZE, will be featured in Teaching Music Through Performance in Band, Volume 10, edited by Eugene Migliaro Corporon and released by GIA Publications December 2014. Ms. Shapiro has presented workshops on electroacoustic music and social media at both the 2013 Midwest Clinic in Chicago, and the 2014 Texas Music Educators Association in San Antonio. Shapiro’s music, as well as her award-winning nature photography, can be enjoyed on her blog, www.notesfromthekelp.com and on her website, www.alexshapiro.org.

Focus on New Repertoire

The e-Frontier: Electroacoustic Music, Multimedia, Education, and Audiences in the Digital World (Part 2)

by Alex Shapiro

Multimedia

Music is entertainment. Whether we’re offering a casual pops performance or a formal concert, one of our goals as musicians is to cause instrumentalists and audiences to experience something—from enjoyable distraction to transcendent exaltation, and everything in between. It isn’t just our ears that register a musical experience. Our bodies feel its impact, and most of the time our eyes are…open. Remember: we don’t call it hear business, we call it show business.

Technology is forging a world increasingly oriented to images and interaction. From infancy, each new generation engages with devices that not long before were unimaginable. Human nervous systems continue to adapt and evolve to handle the tools we create, in order to process information in new ways. If any of us could predict the future, we’d be the most popular person at a party (and fantastically wealthy!). But even without that ability, we can alter our thinking so that rather than simply devise creative uses for existing technologies, we can train ourselves to observe current trends, and strategically envision likely outcomes in the years to follow.

When we talk about prospective technologies that will shift the essence of our daily life and behavior, our conversation is almost pointless if we focus on “the brand new very cool thing that just came out and is absolutely amazing”. It’s better to think like chess players, and anticipate as many moves ahead of “that new thing” as we are mentally and imaginatively capable. Our task is to foresee the existence of an as-yet-unknown tool, and consider how musicians might use it to communicate with audiences.

Welcome to the most exciting time in the history of music composition and performance.

So far.

Every new technology is a prototype for the next. Fascinating as they may be in 2015, Google Glass, MIDI-controlled gloves that trigger music through movement, 3D printing, and clothes with built-in processing chips and Wi-Fi, are not end-point inventions but the next logical steps beyond what we now use every day. We can look at any current gizmo forensically, tracing its developmental history. By reviewing the elements leading to its present form, we’re given clues that point to future trends. Let’s do our best to think freely—wildly, even—about what could be possible if we didn’t limit our thoughts by thinking practically.

Letting go of one’s knowledge of how things have always been is among the most important techniques for successful paradigm shifting.

There are numerous examples—too many of which are distressing—of how the concept of letting go applies to the music industry and its changing income streams. Traditional ways in which music creators have been paid for our work are disappearing, while other opportunities are springing up—particularly for artists with entrepreneurial leanings. However, the exchange of old for new is not evenly weighted, and the process of discovering innovative, money-generating tactics can be daunting. Yet that process is also necessary, because regardless of our varying opinions of the latest tools, they are unavoidable.

The philosophy of embracing change along-side the status quo applies not just to the music business, but also to the way artists offer music to contemporary audiences.

Visuals

Most of us stare at screens with moving images of light and color during many of our waking hours. Our smart phone. Our computer monitor. Our tablet. Our gaming system. Our television. And yes, even that increasingly quaint thing called a movie theater screen, whose popularity seems to be in parallel decline with the shrinking costs of enormous flat-screen TVs and easy home theater setups. We’re like birds, whose attention flits to any shiny object in motion. In our screen-addicted culture, that motion is very, very often viewed…with music. And that music is very, very often heard…and with images.

More music is consumed via YouTube than any other delivery system. Think about that. Rather than listen to a recording, people choose to watch it. Even if, as in too many instances, the sound from their computer’s tinny internal speakers, or even mid-level external speakers, is considerably sub-par to the most basic home stereo system. There are plenty of [often illegal] uploads to YouTube that are purely audio, with only a static title card to view. But much of the medium is genuinely, and often engagingly, video.

What’s also striking about the majority of screen-based technologies, is that they are interactive. After decades of passively staring at television and movie screens, now multi-directional real-time communication is the norm. From social network sites, to web video conferencing, to multi-player online games; whether between two people or multiple individuals in many countries, our ability to engage instantly with each other is remarkable.

Perhaps the concept of screens will be laughably obsolete not long from now, when the emphasis on visual media shifts to a more complete “sensual” media that fully reflects our physical reality as mammals. But for the moment, audiences are becoming accustomed to seeing something when they hear something—not only when they’re looking at a screen, but when they’re looking at instrumentalists during live performances.

Imagination

Traditional concert decorum usually dictates that the audience remain politely seated, quiet, and nearly motionless. Somewhat ironically, these guests absorb the power of music while staring at a stage filled with
fellow humans eliciting that power, who, with the exceptions of the conductor and a few busy percussionists, are also expected to be about as motionless as their audience. I’m not alone in thinking that this physically restrictive convention of past eras can sometimes be contrary to the very nature of the art that is being communicated. Whether listening to sound waves or creating them, we feel music with our bodies. It’s only natural that music moves us to… move.

Once we begin thinking physically, visually, and even multi-dimensionally about live concerts and ways to bring music to audiences that venture beyond that which has become habit, the possibilities rapidly multiply. What about adding lighting effects? Black light, even? Photography, or video, behind or around the stage? How about live dancers, actors, athletes, to add an additional human, expressive element? How about moving the band around the hall instead of seating them in traditional format? Or moving the air around the hall, and other more subtle sensory ideas?

What about getting the audience involved by giving them something specific to do that enhances the performance? Maybe ask them to keep their cell phones on during the concert so they can receive live tweets containing videos, photos, text, or even sound. Perhaps invite them to get out of their seats to listen from different places in the venue, or to walk closer to the stage to physically feel the power of the instruments. And what about using online services to stream the concert for the rest of the world to enjoy? After all the effort that has gone into the preparation of any piece of music, whether standard repertoire or a new work with ink that’s still wet, the fruits of those labors deserve to be experienced by as many people as possible.

For concerts presented by students, why not ask them to come up with ideas for the performance, as well? Free-association brainstorming is one of the best ways to encourage young, creative minds. Each of these ideas, and myriad others that come to mind as you read this, point to one very important thing: engagement. Engagement of the musicians who put the notes into the air. Engagement of the audience who may have arrived at the hall expecting to passively sit back and have every piece on the program wash over them, and are now wowed by the simplest of unexpected visual or sensual additions. The more interactive we, as composers, conductors, educators, programmers and instrumentalists can be with the very people consuming what we create, the more riveting and alive the arts will remain.

Traditional concerts are wonderful. It’s a pleasure to settle into a seat and be emotionally transported by the magic of sound. In addition to – not instead of – these kinds of performances, we can also remain relevant to the current generation, who will become our musicians, patrons, and music lovers in the very near future. These days, those people are always, always, looking at something – and often interacting with it, as well.

Collaboration

Collectively summoning ideas and inviting input from others to present a piece, or an entire program, can be a joy. A band room with a laptop, a projection screen, and a web connection, provides a multidimensional experience for students and can deeply impact their ongoing relationship to music. The camaraderie and creative fun that can result from connecting the band director, the composer, and the students turns performance preparation into a special project.

Educators shouldn’t hesitate to contact composers and invite them to interact with their students, even if a physical visit isn’t possible. It’s simple to bring a composer into a band rehearsal via live web video such as Skype, Google Hangout, Facetime, or other e-methods. The pursuant conversations, coaching and collaboration are exceptionally effective in engaging the students. How did the piece come about? What was the composer’s inspiration? When did s/he begin writing music? What’s the name of her cat? Why did he write that high line for a low instrument? What’s his favorite rock band? Very significantly, the students get a sense of composers as people – and that familiarity connects them to the black dots on the page and where those dots actually came from.

There’s no better way to get younger musicians excited about learning their instruments and stretching their imaginations, than to respect their ideas and bring them into the creative process as worthy individuals and contributors. So ask them: Who’s got some unusual multimedia ideas for the performance? What crazy things might be possible?

In 2010 when I workshopped PAPER CUT with the local middle school band in Friday Harbor, Washington, I first demonstrated the techniques I had invented using sheets of paper as percussion instruments. Next, I encouraged the students to come up with additional musical and visual paper effects. Suddenly, forty exuberant kids became virtuosi of recycled junk mail, and I immediately incorporated some of their ideas into the performance.

As I begin composing an electroacoustic band piece, LIGHTS OUT, I’ll be Skyped into the band room of each of the commissioning high schools around the U.S., and I’ll invite the students to offer their ideas.
A Skypehearsal between Alex in Washington and Brad Schneider and his band at Middleton High School in Wisconsin.

Brevard College band director brought Alex and composers Jonathan Newman and Steven Bryant into the auditorium in North Carolina using a Google Hangout.

Conductor Jerry Luckhardt and Chris Chapman Skyping Alex into a rehearsal at Oregon State University.

for the intermedia aspects of the performance. Some of the resulting concepts will be used in the premieres, and the rest will be listed on a page in the score as suggestions to inspire the bands who perform the piece in the future.

The act of sharing ideas, having a laugh, encouraging participation, and allowing a composition to evolve and expand, is among the most powerful ways to ensure someone’s genuine, lifelong affinity for the arts. As a composer, I coach many ensembles via Skype sessions, which I’ve dubbed “webhearsals” or “Skypehearsals”. Each one seems to draw students emotionally closer to the music on their stands.

Admittedly, until the day arrives in which everyone has lightning-fast internet connec-tivity, the sound quality over the web is frustrat ingly compromised because of variable speeds and data compression. In spite of this, these interactions are still powerful for generating a connection between the musicians, the piece they’re playing, and from where – and from whom – all that music began. When I swivel my webcam and show everyone in an ensemble an expanse of islands and mountains at my toes, the most beautiful sound of all is hearing the lilting sighs of 80 instrumentalists, often sitting somewhere that’s land-locked. When they see an enthusiastic composer on their screen sharing the things that mean the most to her, musically and otherwise, players subsequently interpret the piece with a freshly humanized perspective. I’m convinced that the best place from which we make music is from a shared sense of awe.

Concert e- ttendance

Along these same lines of using the web to build excitement in the band room, composers anywhere in the world can easily be Skyped in to concert halls to introduce their piece, thank the ensemble, engage the audience, and form an emotional connection between where a composition was created and where it’s being experienced.

Among the most poignant of moments occurred during a 2013 performance of my electroacoustic wind symphony written about the sea, IMMERSION, conducted by Tom Duffy at Yale University. After speaking to the audience from San Juan Island, Washington, and describing my love of the Pacific Ocean that inspired the piece, I pointed my webcam to the horizon to provide a live video accompaniment. As the ensemble played, the audience gazed at a large screen behind the band, projecting waves rolling across the ocean surface and crashing into rocks 2800 miles from Woolsey Hall in New Haven, Connecticut. The music and I had come full circle, and the emotion of this truth was palpable: intangible sounds I once heard only in my head while viewing these waters, were now launched into the air and shared with hundreds of people, all staring at the very same sea from which the music itself was spawned. Through these 25 shared minutes of real-time sound and visuals, technology enabled a very human, geographic, and profound connectivity. All that was missing was the sultry scent of the kelp-laden salt-water, and perhaps future inventions will make that possible.

The view from my desk of the Yale Concert Band with conductor Tom Duffy, and the same view from Woolsey Hall, as photographed from my desk!

Composers may think they’re in the music-making business, but really, they’re in the relationship-making business. Meaningful connections can be established anywhere where we choose to form them.

Continuous conversations

Facebook, Google+, Snapchat, Tumblr, Vine, YouTube, Instagram, Pinterest, Twitter, and countless other social networks that will come into their own in the coming years (as some of the current ones go the way of Friendster and MySpace), are superb ways to keep momentum and buzz going between students and their community, and between composers and those who are playing our music. The social networks are everyone’s town square.

After I’ve done a webhearsal with a band, it’s not uncommon for Facebook and Twitter to light up with happy comments from the students and band director, along with my return volley of thanks and continued dialog with people who, only an
hour earlier, I didn’t know. I post screen-shots of Skypehearsals or photos of concerts, tagging the band director and rapidly spreading the word about my fun experience with the ensemble. Think about it: if a composer reaches fifty students at once each time s/he enters their band room via a screen and a smile, and does that on average once or twice a week, that creator – no matter where they happen to live – is soon influencing thousands of new musicians. Being a good musical citizen, supportive of others who spend a great deal of time on my music, is very important to me. Without them, my pieces would merely be silent designs on a page.

I encourage bands to upload their concert videos to YouTube, because it increases excitement about contemporary music and original performance ideas, and gives the band a lasting archive of their experience. I add these videos to my own YouTube channel, to help further the efforts of the schools as new audiences view their performances. For instance, in 2010, high school band director Peter Guenther involved his Owatonna, Minnesota students in designing a multimedia lighting presentation of my then-new work for electroacoustic wind band, PAPER CUT. By posting his band’s striking “black light, on white paper, with colored LED lights, glowing in the dark” performance on YouTube, Peter and his students’ creativity unexpectedly inspired countless ensembles in the U.S. and around the world to follow suit. The video spread exponentially, and suddenly many performances of the piece used these and other fun visual effects, thus giving the music a fun visual effects, thus giving the music a

to the double bar. A simple request, for sure, and each time, the audience hollers in applause triggered not even as much from the music they just heard, as from the joy that they just saw.

From the first black light performance in Minnesota conducted by Peter Guenther...

...to the next in Singapore, conducted by Brian White.

A recent Skypehearsal in black light, with the Detroit Symphony Orchestra Civic Youth Symphonic Band conducted by Kim Eberly:

The power of a Twitter community can’t be underestimated. The social network is great for creating buzz and anticipation about an upcoming concert. For instance, in 2012 when Chicago’s Fifth House Ensemble premiered my chamber sextet about love titled PERPETUAL SPARK, they used Twitter to invent imaginary characters with little online dating dramas that followers were able to read about voyeuristically for days, before arriving at each of the concert venues. By the time people were in their seats, the drama continued in live tweets projected on a screen, accompanying the music and turning the concert into a charming soap opera. Fascinatingly, the romantic storyline continued even after the concerts, perhaps evoking a memory of the music that was heard at the venue.

Using technology to become more human

No matter how many high-tech elements might be involved in composing and producing a piece, the primary connection is not machine-made, it’s human-made. I’m an avid amateur nature photographer. I live on a remote island of sublime peace and beauty, and I love to share vistas and wildlife encounters with the rest of the world. Plus, what better way to procrastinate on the music I’m supposed to be writing, than by jumping up from my desk throughout the day to catch a photo of a breaching whale or a cute fox at the doorstep?

And so, the pages of my website (www. alexshapiro.org) are filled with many of my photos. I use them on the covers of my large ensemble scores, and to enhance the private score delivery pages sent to conductors and performers. When someone peruses my online presence, they get a very good sense of the person behind the notes, and what matters to her. This is deeply important to me, and is the first in my steps toward building an affinity between myself and someone who quite possibly I’ll never meet in person. I lure them into my music, by inviting them into a meaningful part of my life.

With these positive experiences in mind, I encourage my peers to add visual elements to their websites to draw visitors into the sphere of their unique music. Everyone has something that’s important to them, that is not too personal to share with the world. Whether it’s photos of their pet, their meals, their unusual collection of X, Y, or Q, or of...
any interest that might be compelling to others, images are a powerful way to create an environment that entices people to hear the music that is the expression of a composer’s life.

In order to access the audio track downloads necessary to perform my electroacoustic works, the front matters of the score include instructions to send a friendly email to my company, Activist Music. I receive the request, and respond with a personal email that includes the private access codes. I also provide a link to additional resources that will be helpful for rehearsals, and mention the possibility to book me to coach the band or to say hello to the audience via Skype. Additionally, I encourage the band director to let me know when the performance of the piece will be, so I may help publicize their concert on my website. In short: I introduce myself and begin a professional and valued friendship.

I establish contact and build this bridge first and foremost because it’s my jovial nature: I really like people, and especially fellow musicians. I do it because I’m collaborative, and love interacting with those who bring my music to audiences. And perhaps at the top of the list, I reach out, because it inspires me to inspire music students. Whether or not any of these young people eventually become a band director or composer themselves, or the second trombone in an orchestra, or an architect or a plumber who enjoys going to concerts, I get to have a small, and hopefully positive, impact on someone’s personal enthusiasm for living music. Using the tools of my generation, I’m defining my own job description as a composer, gladly taking on additional tasks and devoting time not only to composing music, but to composing relationships. I happily recommend this approach to my peers, because the joy of connection is worth every moment of extra effort. When technology is paired with the heart, we have endless ways to give others an entertaining and meaningful experience through music.

Called “one of the most noteworthy composers for the 21st century wind band” by Carthage College and Dr. James Ripley upon the premiere of her 2014 electroacoustic symphonic wind band piece LIQUID COMPASS, Alex Shapiro has emerged as a pioneer of inventive approaches that use new media to create music and meaningful relationships among colleagues. Drawing from a wide musical palette that defies genre, Shapiro’s acoustic and electroacoustic works, published by Activist Music, are performed and broadcast daily across the U.S. and internationally and can be found on over twenty commercially released recordings from around the world. In 2011, the national music fraternity Mu Phi Epsilon presented Ms. Shapiro its highest distinction, the Award of Merit, for her innovative use of new technologies in composing and for her efforts in encouraging her colleagues.

Alex is the author of a chapter titled, Releasing a Student’s Inner Composer for the 2013 GIA Publications book, Musicianship: Composing in Band and Orchestra, and two of her groundbreaking electroacoustic wind band pieces for high school musicians, PAPER CUT, and TIGHT SQUEEZE, will be featured in Teaching Music Through Performance in Band, Volume 10, edited by Eugene Migliaro Corporon and released by GIA Publications December 2014. Ms. Shapiro has presented workshops on electroacoustic music and social media at both the 2013 Midwest Clinic in Chicago, and the 2014 Texas Music Educators Association in San Antonio. Shapiro’s music, as well as her award-winning nature photography, can be enjoyed on her blog, www.notesfromthekelp.com and on her website, www.alexshapiro.org.

At the 2013 Midwest Clinic after a successful presentation about the e-Frontier: from L-R: Band directors Peter Guenther, Jerry Luckhardt, Craig Kirchhoff, Mark Walker, Miller Asbill, and composers Steven Bryant and Alex Shapiro.
